创建并运行spring boot项目

一、创建spring boot项目

1、新建

2、通过 spring initializr创建

3、填写项目相关信息

4、选择项目的相关组件(组件可以在后期的开发中自己添加)

5、填写项目保存路径

6、创建项目成功

7、等待maven拉取相关依赖后吗,点击运行

二、配置项目

1、配置数据库

项目的配置文件是application.properties

```
#服务器运行端口
server.port=8090

#配置mysql驱动
spring.datasource.url=jdbc:mysql://127.0.0.1/demo?characterEncoding=UTF-8&serverTimezone=UTC
#数据库用户名
spring.datasource.username=monty
```

```
#数据库密码
spring.datasource.password=root
#数据库的驱动类
spring.datasource.driver-class-name=com.mysql.jdbc.Driver
spring.jpa.database-platform=org.hibernate.dialect.MySQL5Dialect
#mybatis
mybatis.configuration.map-underscore-to-camel-case=true
mybatis.type-aliases-package=com.monty.community.model
mybatis.mapper-locations=classpath:mapper/*.xml
```

2、配置mybatis-generator

(前置条件: 需要在数据库中创建数据库并且创建表)

在pom.xml文件中配置

1、添加依赖和plugin

```
<dependency>
    <groupId>mysql</groupId>
   <artifactId>mysql-connector-java</artifactId>
   <version>8.0.19</version>
</dependency>
<!--
           配置mybatis-->
<dependency>
    <groupId>org.mybatis.spring.boot</groupId>
    <artifactId>mybatis-spring-boot-starter</artifactId>
    <version>2.1.1
</dependency>
<plugin>
    <groupId>org.mybatis.generator
    <artifactId>mybatis-generator-maven-plugin</artifactId>
    <version>1.3.7
    <dependencies>
       <dependency>
           <groupId>mysql</groupId>
           <artifactId>mysql-connector-java</artifactId>
           <version>${mysql.version}</version>
       </dependency>
    </dependencies>
</plugin>
```

2、在resources文件夹下新建<mark>GeneratorConfig.xml</mark>用来配置mybatisgenenrator

```
cproperty name="nullCatalogMeansCurrent" value="true"/>
         <!-- MySQL8默认启用 SSL ,不关闭会有警告-->
         cproperty name="useSSL" value="false"/>
      </jdbcConnection>
#指定生成的mode1类存放文件夹
      <javaModelGenerator targetPackage="com.springboot.demo.model"</pre>
targetProject="src\main\java">
         cproperty name="enableSubPackages" value="true" />
         cproperty name="trimStrings" value="true" />
      </iavaModelGenerator>
#指定生成的mapper类的存放位置
      <sqlMapGenerator targetPackage="mapper" targetProject="src\main\resources">
         cproperty name="enableSubPackages" value="true" />
      </sqlMapGenerator>
#指定生成的.xm1文件的存放位置
      targetProject="src\main\java">
         cproperty name="enableSubPackages" value="true" />
      </javaClientGenerator>
#指定mode1中的类和数据库中的表的对应关系
      </context>
</generatorConfiguration>
```

3、运行命令(命令行运行)

mvn -Dmybatis.generator.overwrite=true mybatis-generator:generate

三、前后端分离编程

1、在src目录下controller包,然后新建HelloController类

```
@Controller
public class IndexController {
   @Autowired
   private UserMapper userMapper;
   @GetMapping("/")
   public String index(){
       return "index";
//前后端分离,使用ResponseBody注解,使用UserMapper从数据库中user表获取信息,将数据传递到页面
   @ResponseBody
   @RequestMapping(value = "/getuser")
   public List<User> getUser(){
       UserExample userExample=new UserExample();
       List<User> users=userMapper.selectByExample(userExample);
       return users;
   }
}
```

2、运行项目,访问接口

[{"id":1, "name":"y"}, {"id":2, "name":"s"}, {"id":3, "name":"wsdf"}]
